***Abstract*—This scientific paper will talk about drug warehouse system and applications, through this study will learn about the importance of systems, one of the main objectives of the study is design a flexible database that gives ease of modification and use of data so that data is not lost, this study The study used the descriptive approach, the most prominent results of the study are a system that gives satisfactory results.**

***Index Terms*—System, warehouse, Pharmaceutical warehouse, Management System**

I. Introduction

The warehouse it's money, so it is important, but without a clear view of your merchandise from the date of initial receipt to the date of shipment your company's biggest asset could make you lose money, warehouse Management System is software that helps you simplify all the moving parts of your warehouse: from recommending optimal inventory levels all the time to organize your supply chain and running smoothly, investing in a drug store warehouse management software can yield an excellent return on investment. If your company sells any kind of physical product, you already know a little bit about warehousing, in most basic warehousing is figuring out where and how to store your product (or their components) before they're needed for assembly, store display, purchase, or anther final destination. Pharmaceutical warehouse inventory management software tracks, manages and organizes inventory levels, orders, sales and deliveries. The purpose of inventory management software is to maintain an optimum stock level, keep track of goods in transit between locations, receive new items, manage warehouse operations such as picking, packing and shipping, prevent product obsolescence and damage. Inventory management software automates what used to be a time-consuming manual process of counting each item one by one and recording it on paper. Digitizing this process not only makes it more accurate, but saves valuable time.

II. Problems

- A Problem with confidence The results are not satisfactory because they are done by individuals.
- Files lost because accumulation of paper.
- Can not control of inventory systems.
- Can not organization of stock and dividing it according to fairness and the presence of overcrowding and choking points.

III. Objectives

- Design a system given satisfactory and more accurate.
- Create a flexible database.
- Get a backup to ensure that files are not lost.
- Develop instructions for stock handling.

IV. Materials

The code was written in Visual Studio because it is suitable for database applications, applications for small companies, and accounting programs. It is convenient, easy, and serves the purpose. In addition, it allows the programmer to focus on solving the problem, as he often finds technical difficulty while writing a program in Visual Studio.
The database was Created by SQL Server.

V. Methods

The study followed the descriptive method, which is appropriate method for this topic. The date was collected and analyzed by means of a comprehensive inventory and was designed with waterfall model.

System

A. Concept of Drugs Warehouse System

The Pharmaceutical Warehouse system is the system specialized in keeping and taking care of stocks, in other words, it is the one who cares about everything related to warehouses while following the storage conditions for them in terms of appropriate storage method, spaces inside the store and corridors, methods of transportation, receipt, examination, expiry dates and validity, and securing the store and appointing the staff inside the store.

B. Type of warehouse system

There are many different type of warehouse systems, and large number of option within each of these categories. In order to make an informed, you must understand what the good are, and of the type of systems, **Standalone Systems, Supply Chain Modules, ERP Modules, Cloud-Based Systems.**

- STANDALONE SYSTEMS
  It is a local system independent of the main system, and the lowest in price . The Standalone system can display invoices, insert and take out medicines, display, reports, track expiry date, track arrival and shipment date.
  Most standalone System are sold as standalone packages that are installed and then integrated with the main system. The integration of the program works with the main program. but often causes problems such as frequent data entry and user interface problems.
  The standalone system that manages warehouses only and is not linked to the main system and the rest of the warehouse systems are linked with as
  A standalone warehouse management system can be used as an inventory management system.
- SUPPLY CHAIN EXECUTION MODULES
  It a considered a subcategory of main system . SCM software has a broad scope by nature and can assist users to manage many aspects of the supply chain.
  Using a supply chain module as your WMS requires that your business invests in supply chain applications that also provide warehousing features.
- ERP MODULES
  It is a fully enterprise management system, ERP software is a powerful solution that combines many capabilities found in other systems.ERP is a specialized system that can offer a solid supply chain execution and scalability.
  Those core application can include, but aren?t limited to:
  SUPPLY CHAIN PLANNING
  ACCOUNTING
  CUSTOMER RELATIONSHIP MANAGEMENT
  HUMAN RESOURCES

- CLOUD-BASED WAREHOUSE MANAGEMENT SYSTEM
  It is a web-based, centralized-computing model that employs cloud technology.
  Cloud-based WMS is often provided using ?software-as-a-service? (SaaS) and is noted for its quick scalability and deployment. It can supply the same benefits of a more traditional WMS while also providing faster implementation and lower costs.
  The systems is low maintenance because it is hosted on a separate or private server, depending on specifications
  It is the most secure because it is on a separate server, which is important for businesses that manage high-value inventory or companies want more security
  CLOUD-BASED WAREHOUSE MANAGEMENT SYSTEM is well-suited for business with multi location needs and offers much in terms of system flexibility can adapt to your business productivity regardless of operational size, volume or complexity.

VI. Results

1) Designed user interfaces for buying and selling. And one of the most important user interfaces is in following figures

Fig. 1. user interface to add to the warehouse

Through it, you can enter the data of new drug, extract an existing drug, and view the data of the existing drugs modify the data of medicines in the repository .

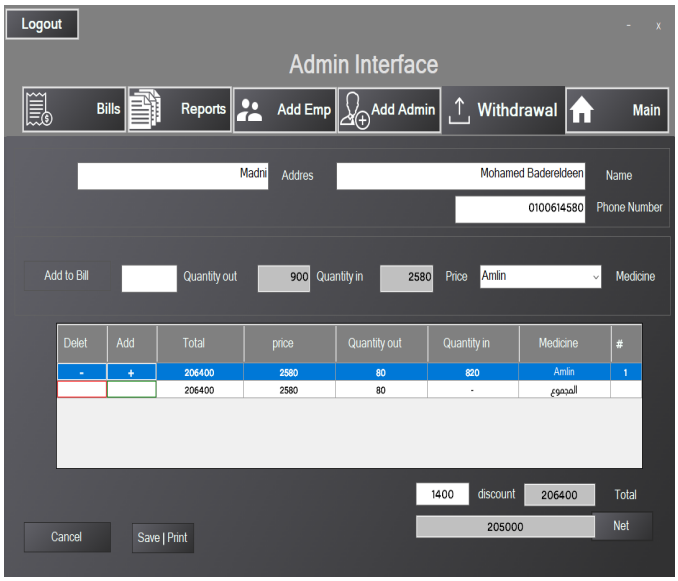

Fig. 2. user interface for sale

Through which drugs can be withdrawn form the warehouse and any quantity og the drug can be determined, and if the quantity is not available, the withdrawal will not take place, a discount will be made for the product and the customer's data will be recorded

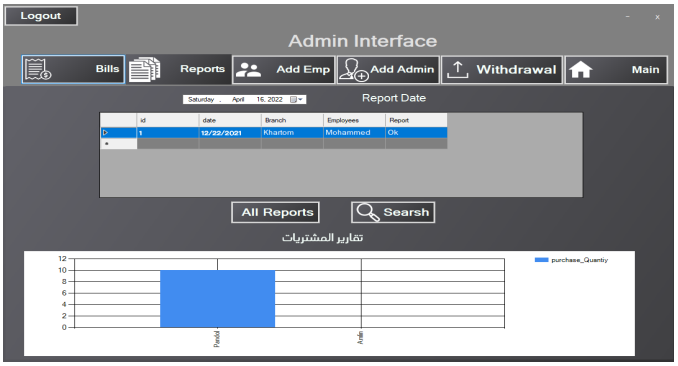

Fig. 3. user interface for reports

Shows you the report decisions by employees, their notes, and reports of best selling drugs

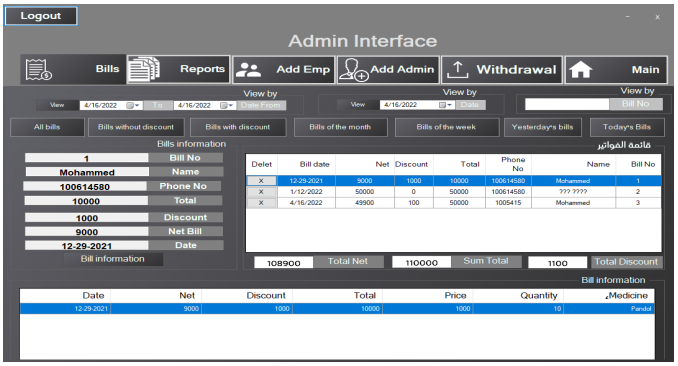

Fig. 4. user interface for display Bills

Displays the bills, and it possible to know the bills of day,a week, a month, the date of specific day, or a specific date between tow periods, severing bills, and displaying bill details.

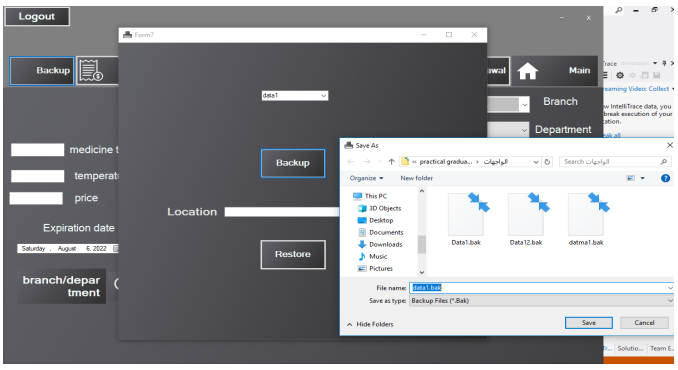

Fig. 5. user interface for BACKUP DATABASE

User Interface used to create a backup and restore
you can make a backup copy pressing the backup button, you can restore it by choosing the path of the bakup file and then pressing the restore button.

2) a database that gives flexibility modifying and using data easy
3) Control of warehouse
4) All supplier and customer and drug classes records are present in system .
5) Bills for sale in the system .

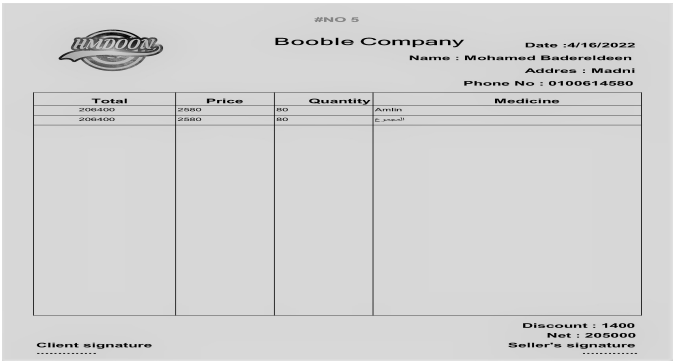

Fig. 6. Invoice

6) The electronic system is better than the paper system.

VII. Discussion

The user interface Designed by looking system similar to warehouse and drug systems and diligence, the database was created by knowing the appropriate fields for the system
The electronic system is better than the paper system because
1.Ease of searching in the electronic system
2.warehouse and branches are connected to each other
3.The warehouse is divided by items

It is recommended to develop the system to suit large companies.

VIII. Conclusion

With the development of modern technology, it was necessary to leave the paper system and switch to the electronic system, and with the study of the drug warehouse system, we have reached to enhance confidence in the results and not to lose files with the presence of a backup copy. The system is organized and divided according to categories. The ability to search for a product is easy

Acknowledgment

Thank you to Mrs. Odeh Yassin Youssef for hr supervision and follow up for the graduation project
IEEE Team to give us a chance to participate in 50 paper challenge and give us instructions and notes for scientific paper
